

APPROPRIATE METHODS TO MAP LOCATION OF DEFIBS

A National Register has been rolled out by Community First Responders (CFR) Ireland in a bid to keep track of automated external defibrillators in workplaces and communities around Ireland, while members of the public can also take 'selfies' alongside these lifesaving devices using a unique and innovative 'Save a Selfie' app. Report by Elaine O'Regan.

Since starting the 'Save a Selfie' campaign in April 2016 Dublin firefighter and paramedic Seán Peters' interest in the use of technology to support the emergency services has evolved further with the launch of his non-profit venture – the Emergency Mobile Alert & Information Network (EMAIN).

'Save a Selfie' started out as a crowdsourcing campaign last year, aimed at raising public awareness of the country's automated external defibrillators (AEDs). These portable medical devices are used to check heart rhythm and, where Sudden Cardiac Arrest is detected, deliver an electric shock to normalise the rhythm.

"I set up the campaign to help raise awareness of the location of defibrillators and other life-saving devices," says Peters.

"It came about a year-and-a-half ago, where a young child unfortunately went into cardiac arrest at a school football match. When they got the team defibrillator out to treat the boy, they realised that the battery was dead.

"The app lets people take a selfie with a defibrillator. Once

they upload it, it goes on to an online map, so we can plot its location with the GPS on the phone."

SAVE A SELFIE

There are thought to be up to 10,000 AEDs around the country, according to Peters, but he claims that up to 10 per cent no longer work, due to dead batteries or outdated devices.

To register an AED with CFR Ireland, email Andy O'Toole at aedregister@cfr.ie

“People do not necessarily realise that AEDs don't work. They think ‘leave it, don't touch it’, but we want people to familiarise themselves with the

machine and ensure it's in working order,” he says. Over a nine-month period, 2,800 photos were uploaded to the ‘Save a Selfie’ app, and it's proving to be very successful, he claims.

“AEDs are very robust. We use them every day in the emergency services and what we want to do is get that message over to general members of the public.” Séan Peters established a non-profit organisation – Emergency Mobile Alert & Information Network (EMAIN) – to develop smart technologies that can help the emergency services and the public work together.

With a background in smartphone technology and emergency communications, he has secured €10,000 in funding from The Ryan Foundation and also received €5,000 in 2016 from Social Innovation Fund Ireland's inaugural Animate Programme. (This programme supports early stage innovations, projects and organisations to get to the next stage of their development).

COMMUNITY ASSET PROGRAMME

EMAIN is developing a Community Asset Programme (CAP) using software that will help both communities and organisations alike to keep a better track of the usage and maintenance of automated external defibrillators.

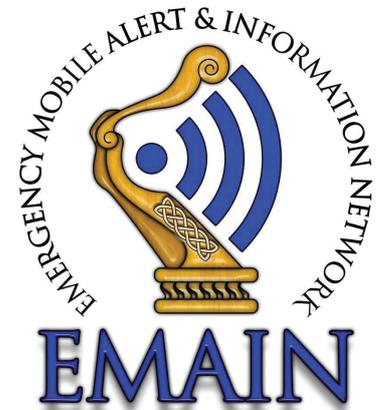

CAP will also generate a heat map of the location of current devices with the aim of helping local communities to plan new locations for defibrillators to ensure the greatest coverage.

“Save a Selfie was an educational app, but I wanted to use the crowdsourced information I got from that as the starting point for a more detailed database of these devices and their location. That's really where the Animate and Ryan Foundation funding came in,” says Peters.

“We potentially have enough defibrillators around the country at the moment, but many are in the wrong place. A town such as Clonmel, for example, would be very proactive. They have about 20 public access defibrillators and, because it's run under one scheme, the machines are placed strategically around the Tipperary town.”

FURTHER PLANS IN THE PIPELINE

Séan Peters' plans for the Emergency Mobile Alert & Information Network (EMAIN) are moving beyond AEDs. On a national level Peters estimates there are up to 800,000

lifesaving devices in Ireland, including first aid kits, fire hydrants, extinguishers, AEDs and life rings.

And two local authorities – Dublin City Council and Wexford County Council – have now supplied location information to EMAIN for data on lifesaving devices in their own regions.

Also under the EMAIN umbrella, Peters is developing a ‘Smart Ring Buoy’ to help alert the emergency services to drowning incidents. Its aim will be to enable faster response times from rescue services and discourage the theft or vandalism of ring buoys.

“We're looking at future technologies and how to make things easier for the emergency services, as we cannot work any harder than we're already doing,” says Peters. “One way is to have real-time information, so the ‘Life Ring’ prototype has a GPS sensor attached to it, with a battery life of six to seven years.

“We hope to programme that software to alert us when a life ring is used. Just like when a fire or smoke alarm is activated, if someone takes a life ring off its stand and throws it into water, then the emergency services can be activated in real-time within seconds.”

In a situation where a person is drowning, someone will throw them a life ring and it can take five to ten minutes for a call to come into the 999 centre. “We want to improve the response times, so we know almost immediately when there is an issue, and we can reduce incidents of death by drowning using Internet of Things (IoT) technologies.”

With other towns and communities, he claims that there isn't the same co-ordination and thought going into the location of the defibrillators. “So, you might find them in two shops right next to each other, which are then only available when the shops are open. We want to be able to generate a

LIFESAVING DEVICES

location map of these devices and to identify the black spots.

By gathering all of the relevant information on one database, we can see where these assets are then located.”

AED REGISTER

Under a separate scheme, Andy O’Toole, an advanced paramedic based in Wicklow, is heading up a Community First Responders (CFR) Ireland initiative to keep track of the number of AEDs in workplaces and communities around Ireland.

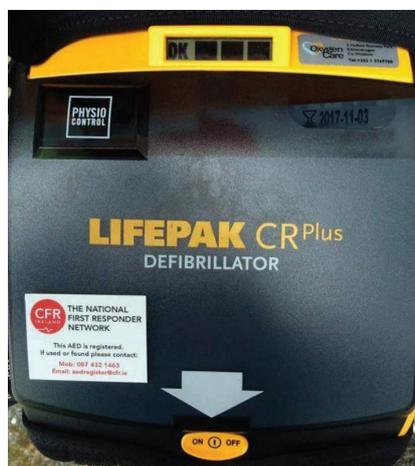

CFR Ireland set up the National AED Register last year, following the publication of the December 2015 HIQA Report into the Public Access Defibrillation (PAD) scheme nationally. This found that there were about 9,000 AEDs around the country.

“We have very enthusiastic volunteers around the country, who came across 425 AEDs in 12 months, so you have to wonder where that 9,000 figure came from,” says O’Toole.

He is working with CFR volunteers to roll out the scheme, which he piloted in Wicklow in March 2016. His aim is to make accurate data regarding the location and quality of AEDs around the country available to the ambulance service.

“The idea with the AED registry is to let homeowners, schools, community groups and businesses register the device with ourselves. We have a commitment from the HSE National Ambulance Service that, if we can get the AED details, they will put it up on their system. There are loads of apps to show you where an AED is, but when someone is in the throes of a cardiac arrest, you’re not going to start using your app.

“In an emergency, when you ring 999 or 112, you want the person on the line to tell you the location of the nearest AED.”

These AEDs are now registered on CFR Ireland’s National AED Network.

AFTER-SALES SERVICE

During the course of rolling out the National AED Register, Andy O’Toole has encountered an unexpected problem regarding the quality and functionality of some AEDs around the country. If we put an AED on the system and it’s not fit for purpose, it could cause more confusion,” he says.

“Some machines were purchased years ago during the Celtic Tiger when there was a lot of money around. However, the pads on those machines are out dated and the batteries are dead.”

Adding to the problem is the large number of different AED makes and models that have been purchased around the country. Therefore, O’Toole sees a need for a more proactive after-sales servicing model.

In situations where CFR Ireland finds a faulty AED, he says they will need to ask the suppliers to look after that piece of equipment without charging an extortionate amount.

Andy O’Toole and RTE presenter Michael Lyster who shared his own personal experience of cardiac arrest at the ‘Respond 2016’ Conference in Mullingar. O’Toole and his colleagues resuscitated Michael after his wife had provided the initial care.

LLOYDS PHARMACY LINK-UP

The Wicklow paramedic has linked up with the Lloyds Pharmacy chain to register AEDs in all 92 of its Irish outlets. “Their internal newsletter, circulated to all of their stores, includes our online registration form, and has highlighted that their AEDs should be registered with CFR Ireland,” he says.

“They’ve come back to us with a view to some in-store advertising on what we’re doing. So, we need to ensure that all AEDs in the country are on the system. When someone calls an ambulance to report a suspected heart attack, they will be directed towards the nearest AED.”
